

! Installation of the chainguide is very simple, but for non advanced users we recommend to install it in your local bicycle service. Improperly installed or used chainguide may endanger your life or health. The brand - mozartt.com is not liable for damages caused by improper use of the chainguides. **!**

1. The bash guard is constructed so that its one side is thicker, and the other is thinner. Between these parts there is a place on the crank, which is the thinnest. Such a structure needs to verify which leg is dominant. There are several ways to check:

- 1** If you ride a bicycle down the hill, stand on the pedals and see which leg is in the front. Use this leg, as dominant when you are assembling this unit.
- 2** Ask someone to suddenly pushed you from behind. This leg, which help you maintain a balance should be in the front of the crank.
- 3** Accelerate and slip as if you were on the ice. Remember which leg is in front of the slip, and use it in the front of the cranks.

2. If you have defined, which leg is dominant - assemble the bash guard so that its thicker side is directed to the bottom when your dominant leg is on the front.
